Department of Artificial Intelligence and Data Science

ASSESSMENT TOOL 3 – CODING CHALLENGE

Course Code:	DSA03	Course Title:	Natural Language Processing
CO Assessed:	CO1 – Imitation (L1)	Assessment:	Assessment Tool 3 – Coding Challenge
Weightage:	30% of CIA		
CO5 Statement:	Analyse NLP models, regular expression patterns, finite state automata, morphological processing techniques and to interpret language processing. (BL-3)		
Student Name:	Nikhil Kumar Reddy Kadiveti	Reg. No.:	192425031
Section / Batch:	2024	Date:	8/10/26

Code of Conduct

I Nikhil Kumar Reddy Kadiveti (192425031) certify that this submission is my original work and that I have adhered to the guidelines specified for this assessment. I understand that any violation of academic integrity rules will result in disciplinary action.

Signature of the Student: *R Nikhil Kumar*

Instructions

- Develop a complete and modular Python program that meets all the functional requirements specified in the coding challenge using appropriate algorithms, data structures, and programming practices.
- Test the program using multiple valid and invalid test cases, and clearly display the input, processing, and output to verify the correctness of the implementation.
- Follow standard coding practices by using meaningful variable names, proper indentation, comments, exception handling (where applicable), and upload the source code, sample outputs, and README file to the designated GitHub repository.
- Duration: 40 minutes.

Section / Topic	Focus	Q Nos
Regular Expression Pattern Matching	Regular Expressions, Basic Regular Expression Patterns	1
Finite State Automata Implementation	Finite State Automata, Models and Algorithms	2
Advanced Regular Expression Search	Regular Expressions, Basic Regular Expression Patterns	3

Section 1: Intelligent Email and Password Validator using Regular Expressions

1. Problem Statement:

A software company is developing a user registration system. Before creating an account, the system must validate user credentials based on predefined security policies.

Develop a Python application that validates:

Email Address

Password

Mobile Number

using Regular Expressions.

Validation Rules

Email

Must start with an alphabet.

May contain letters, digits, '.', '_' before '@'.

Domain should contain only alphabets.

Valid extensions: .com, .org, .edu, .net, .in

Password

Minimum 8 characters

At least one uppercase letter

At least one lowercase letter

At least one digit

At least one special character (@, #, \$, %, &, !)

Mobile Number

Must contain exactly 10 digits.

First digit should be between 6–9.

Expected Output

Display:

Valid Email / Invalid Email

Strong Password / Weak Password

Valid Mobile Number / Invalid Mobile Number

Section 2: Design a Finite State Automata (FSA) Simulator

2. Problem Statement

Develop a Python-based Deterministic Finite Automata (DFA) simulator.

The program should:

- Accept the DFA description
 - States
 - Input alphabet
 - Transition table
 - Initial state
 - Final state(s)
- Accept multiple input strings.
- Simulate state transitions.
- Display whether the string is Accepted or Rejected.

Example

Language:

Strings ending with "ab"

Input

abaab

Output

Transition Path:

$q_0 \rightarrow q_1 \rightarrow q_0 \rightarrow q_1 \rightarrow q_2$

Accepted

Section 3: Smart Pattern Matching Engine using Regular Expressions**3. Problem Statement**

Develop a Python-based text search engine that performs pattern matching using Regular Expressions.

The system should support:

Word Search

Prefix Search

Suffix Search

Date Search

Phone Number Search

Hashtag Search

Mention (@username) Search

Example Input

Meeting on 12/09/2026

Call 9876543210

#NLP

@OpenAI

natural language processing

User Menu

1.Search Date

2.Search Phone Number

3.Search Hashtag

4.Search Mention

5.Search Prefix

6.Search Suffix

Expected Output

Display all matching patterns based on user selection.

Rubrics for Calculation

Criteria	Weightage	Level 4 – Exemplary	Level 3 – Proficient	Level 2 – Developing	Level 1 – Beginning
Problem Understanding	20%	Clearly understands problem constraints, edge cases, and competitive requirements	Understands problem with minor gaps in constraints	Partial understanding; misses key constraints	Misinterprets problem or constraints
Algorithm	25%	Selects optimal algorithm with best time and space complexity for competitive constraints	Uses efficient algorithm with minor scope for improvement	Uses basic/inefficient approach	No clear algorithmic approach
Code Implementation	20%	Writes correct, efficient, and clean code that passes all constraints	Code works with minor errors or inefficiencies	Partially correct code; fails for some cases	Code does not execute or gives incorrect results
Competitive Performance	20%	Solves problem within time limits and handles large inputs effectively	Solves within acceptable time with minor delays	Struggles with time limits or larger inputs	Unable to solve within time constraints
Test Case Handling	15%	Handles all test cases including edge and hidden cases	Handles most test cases	Misses important edge cases	Fails on multiple test cases

Q. No. / Criteria	Problem Understanding	Algorithm	Code Implementation	Competitive Performance	Test Case Handling	Sub. Total	Total %

Question 1 – Intelligent Email and Password Validator using Regular Expressions

Problem Statement:

Develop a Python application that validates an email address, password and mobile number using Regular Expressions according to the security rules specified in the assessment.

- Email must start with an alphabet and may contain letters, digits, '!', '_' before @.
- Domain contains only alphabets and the extension is .com, .org, .edu, .net or .in.
- Password has at least 8 characters, uppercase, lowercase, digit and one special character.
- Mobile number contains exactly 10 digits and starts from 6–9.

Program

```
import re

email = input("Enter Email: ")
password = input("Enter Password: ")
mobile = input("Enter Mobile Number: ")

email_p = r"^[A-Za-z][A-Za-z0-9._]*@[A-Za-z]+\.(com|org|edu|net|in)$"
pass_p = r"^(?=.*[A-Z])(?=.*[a-z])(?=.*\d)(?=.*[@#%&!]).{8,}$"
mobile_p = r"^[6-9]\d{9}$"

print("\n----- VALIDATION RESULT -----")
print("Email:", "Valid Email" if re.fullmatch(email_p, email) else "Invalid Email")
print("Password:", "Strong Password" if re.fullmatch(pass_p, password) else "Weak Password")
print("Mobile:", "Valid Mobile Number" if re.fullmatch(mobile_p, mobile) else "Invalid Mobile Number")
```

Output

The screenshot shows a VS Code editor with a file named `practice.py` containing the Python script. The terminal output shows the execution of the script, which prompts the user for email, password, and mobile number. The output indicates that the email is valid, the password is weak, and the mobile number is valid.

```
PS C:\Users\souja\Downloads\NLP Practical> python practice.py
Enter Email: soujanyaakaveti@gmail.com
Enter Password: bharathi1037
Enter Mobile Number: 9618120426

----- VALIDATION RESULT -----
Email: Valid Email
Password: Weak Password
Mobile: Valid Mobile Number
PS C:\Users\souja\Downloads\NLP Practical>
```

Question 2 – Design a Finite State Automata (FSA) Simulator

Problem Statement:

Develop a Python-based Deterministic Finite Automata (DFA) simulator that accepts a DFA description, accepts multiple input strings, simulates state transitions, and displays whether each string is Accepted or Rejected. The example language is strings ending with 'ab'.

DFA Used for Example

States: q0, q1, q2 | Alphabet: a, b | Start: q0 | Final: q2

Transitions: q0 --a--> q1, q0 --b--> q0, q1 --a--> q1, q1 --b--> q2, q2 --a--> q1, q2 --b--> q0

Program

```
states = ["q0", "q1", "q2"]
final = "q2"

transition = {
    "q0": {"a": "q1", "b": "q0"},
    "q1": {"a": "q1", "b": "q2"},
    "q2": {"a": "q1", "b": "q0"}
}

strings = input("Enter strings separated by space: ").split()

for s in strings:
    state = "q0"
    path = [state]

    for ch in s:
        if ch not in ["a", "b"]:
            state = "dead"
            break
        state = transition[state][ch]
        path.append(state)

    result = "Accepted" if state == final else "Rejected"
    print(s, ":", " " -> ".join(path), ":", result)
```

Output

The screenshot shows a VS Code editor with a file named `practice.py` containing the DFA simulator code. The code defines states, transitions, and a loop to process multiple input strings. The terminal output shows the results of running the program with various inputs:

```
PS C:\Users\sowja\Downloads\NLP Practical> python practice.py
Password: Weak Password
Mobile: Valid Mobile Number
• PS C:\Users\sowja\Downloads\NLP Practical> python practice.py
Enter strings separated by space: I am a student at SIMATS
I : q0 : Rejected
am : q0 -> q1 : Rejected
a : q0 -> q1 : Rejected
student : q0 : Rejected
at : q0 -> q1 : Rejected
SIMATS : q0 : Rejected
• PS C:\Users\sowja\Downloads\NLP Practical> python practice.py
Enter strings separated by space: abab
ababab : q0 -> q1 -> q2 -> q1 -> q1 -> q2 : Accepted
• PS C:\Users\sowja\Downloads\NLP Practical>
```

Question 3 – Smart Pattern Matching Engine using Regular Expressions

Problem Statement:

Develop a Python-based text search engine that performs pattern matching using Regular Expressions. The system supports date, phone number, hashtag, mention, prefix and suffix searches.

- Date Search
- Phone Number Search
- Hashtag Search
- Mention (@username) Search
- Prefix Search
- Suffix Search

Program

```
import re

text = """Meeting on 12/09/2026
Call 9876543210
#NLP
@OpenAI
natural language processing"""

print("1. Dates:", re.findall(r"\b\d{2}/\d{2}/\d{4}\b", text))
print("2. Phones:", re.findall(r"\b[6-9]\d{9}\b", text))
print("3. Hashtags:", re.findall(r"#\w+", text))
print("4. Mentions:", re.findall(r"@w+", text))

word = input("Enter prefix: ")
print("5. Prefix:", re.findall(r"\b" + re.escape(word) + r"\w*", text, re.I))

word = input("Enter suffix: ")
print("6. Suffix:",
      re.findall(r"\b\w*" + re.escape(word) + r"\b", text, re.I))
```

Output

```
PS C:\Users\soojal\Downloads\NLP Practical> python practice.py
5DMS i q0 : Rejected
PS C:\Users\soojal\Downloads\NLP Practical> python practice.py
Enter strings separated by space: abash
abash : q0 -> q1 -> q2 -> q1 -> q1 -> q2 : Accepted
PS C:\Users\soojal\Downloads\NLP Practical> python practice.py
1. Dates: ['12/09/2026']
2. Phones: ['9876543210']
3. Hashtags: ['#NLP']
4. Mentions: ['@OpenAI']
Enter prefix: nat
5. Prefix: ['natural']
Enter suffix: processing
6. Suffix: ['processing']
PS C:\Users\soojal\Downloads\NLP Practical>
```
